Windows system administrator role

Windows system administrators install, configure, and maintain Windows operating systems. They also manage the transition of on-premises environments to hybrid environments that use Microsoft Azure or Microsoft 365 as the cloud component. By using PowerShell, they can automate many of their tasks.

About this course: Prerequisites

Before attending this course, students must have:

- Experience with Windows networking technologies and implementation.
- Experience with Windows Server administration, maintenance, and troubleshooting.
- Experience with Windows Client administration, maintenance, and troubleshooting.

Course outline

Get-Command Get-Date

Learning Path 1: Getting started with Windows PowerShell

Learning Path 2: Windows PowerShell for local systems administration

Learning Path 3: Working with the Windows PowerShell pipeline

Learning Path 4: Using PSProviders and PSDrives

Learning Path 5: Querying management information by using CIM and WMI

Learning Path 6: Working with variables, arrays, and hash tables

Learning Path 7: Windows PowerShell scripting

Learning Path 8: Administering remote computers with Windows PowerShell

Learning Path 9: Managing Azure resources with PowerShell

Learning Path 10: Managing Microsoft 365 services with PowerShell

Learning Path 11: Using background jobs and scheduled jobs

Exercise - Discover objects

1 minute

Sandbox activated! Time remaining: 1 hr 55 min

You have used 1 of 10 sandboxes for today. More sandboxes will be available tomorrow.

In some scenarios, you'll need to manage processes on a machine. If you need to stop some of the processes, you might want to track what processes are running, how many resources they're using, and their process IDs.

Discover an object by using Get-Member

You know that the `Get-Process` cmdlet lists information about processes. Now, you want to find what other cmdlets work with processes and what a process consists of.

In this scenario, you'll use the `Get-Member` cmdlet.

- Run `Get-Process`:

PowerShell

Copy

Get-Process

The table-like response consists of all processes that are running on your machine. The exact response depends on what is running on your machine. Choose a process name from the column on the right, and then use it as an argument for your next command.

- Run `Get-Process` again. This time, use the process name and pipe `Get-Member`.

PowerShell

Copy

Azure Cloud Shell

PS /home/thomas_jaekel> Get-Process

NPM(K)	PM(M)	WS(M)	CPU(s)	Id	SI	ProcessName
0	0.00	93.02	2.67	20	1	node
0	0.00	403.88	13.46	130	127	pwsh

Hands-on labs

- This course requires access to the Azure platform. Access to Azure might be provided through one of the following options:
 - An Azure pass that the Learning Partner or the ALH gives out to students.
 - As part of an ALH Azure solution. Your instructor will provide more information regarding access to Azure.
- You'll use a Microsoft Learning Azure Pass to access Azure.
- After you set up your subscription, check the dollar balance of your Azure Pass within Azure.
- Be aware of how much you're consuming and don't allow Azure components to run overnight or for extended periods.
- Lab instructions are in a GitHub repository. For this class use the *<your region>* location.
